Early identification of technically sound and sustainable water and sanitary interventions is crucial when it comes to saving lives and preventing diseases in almost any disaster situation.

Experience gathered during recent disaster operations demonstrates the urgent need for highly skilled professionals with specialised expertise in water supply and sanitation, as the lack of interdisciplinary personnel has proved to be a barrier to efficient and effective response.

The University of Copenhagen offers an intensive course on water supply and sanitation in emergencies for professionals working with - or aiming to work with - disasters and relief operations.

The course is designed in such a way that each participant attains the knowledge and skills necessary for prompt action in recovery situations, especially in developing countries.

On completion of the course, participants will be able to access and prioritize water supply and sanitation in emergencies with foresight, and make appropriate decisions to prevent disease outbreak.

The course is also a part of the Master of International Health, as well as the Master of Disaster Management, which is offered in close collaboration with Lund University.

Please visit our website for further information about course content, admission and fees.
